

Applikationssäkerhet för testare

Vi behöver prata
om säkerhet!

- Säkerhet är allas jobb. Utvecklare, kravanalytiker, testare och produktägare måste förstå grunderna i säkerhet och veta hur man bygger in säkerhet i programvara och tjänster för att göra produkterna säkrare.
- Alla behöver inte vara säkerhetsexperten eller sträva efter att bli en skicklig penetrationstestare för att kunna bidra i säkerhetsarbetet.

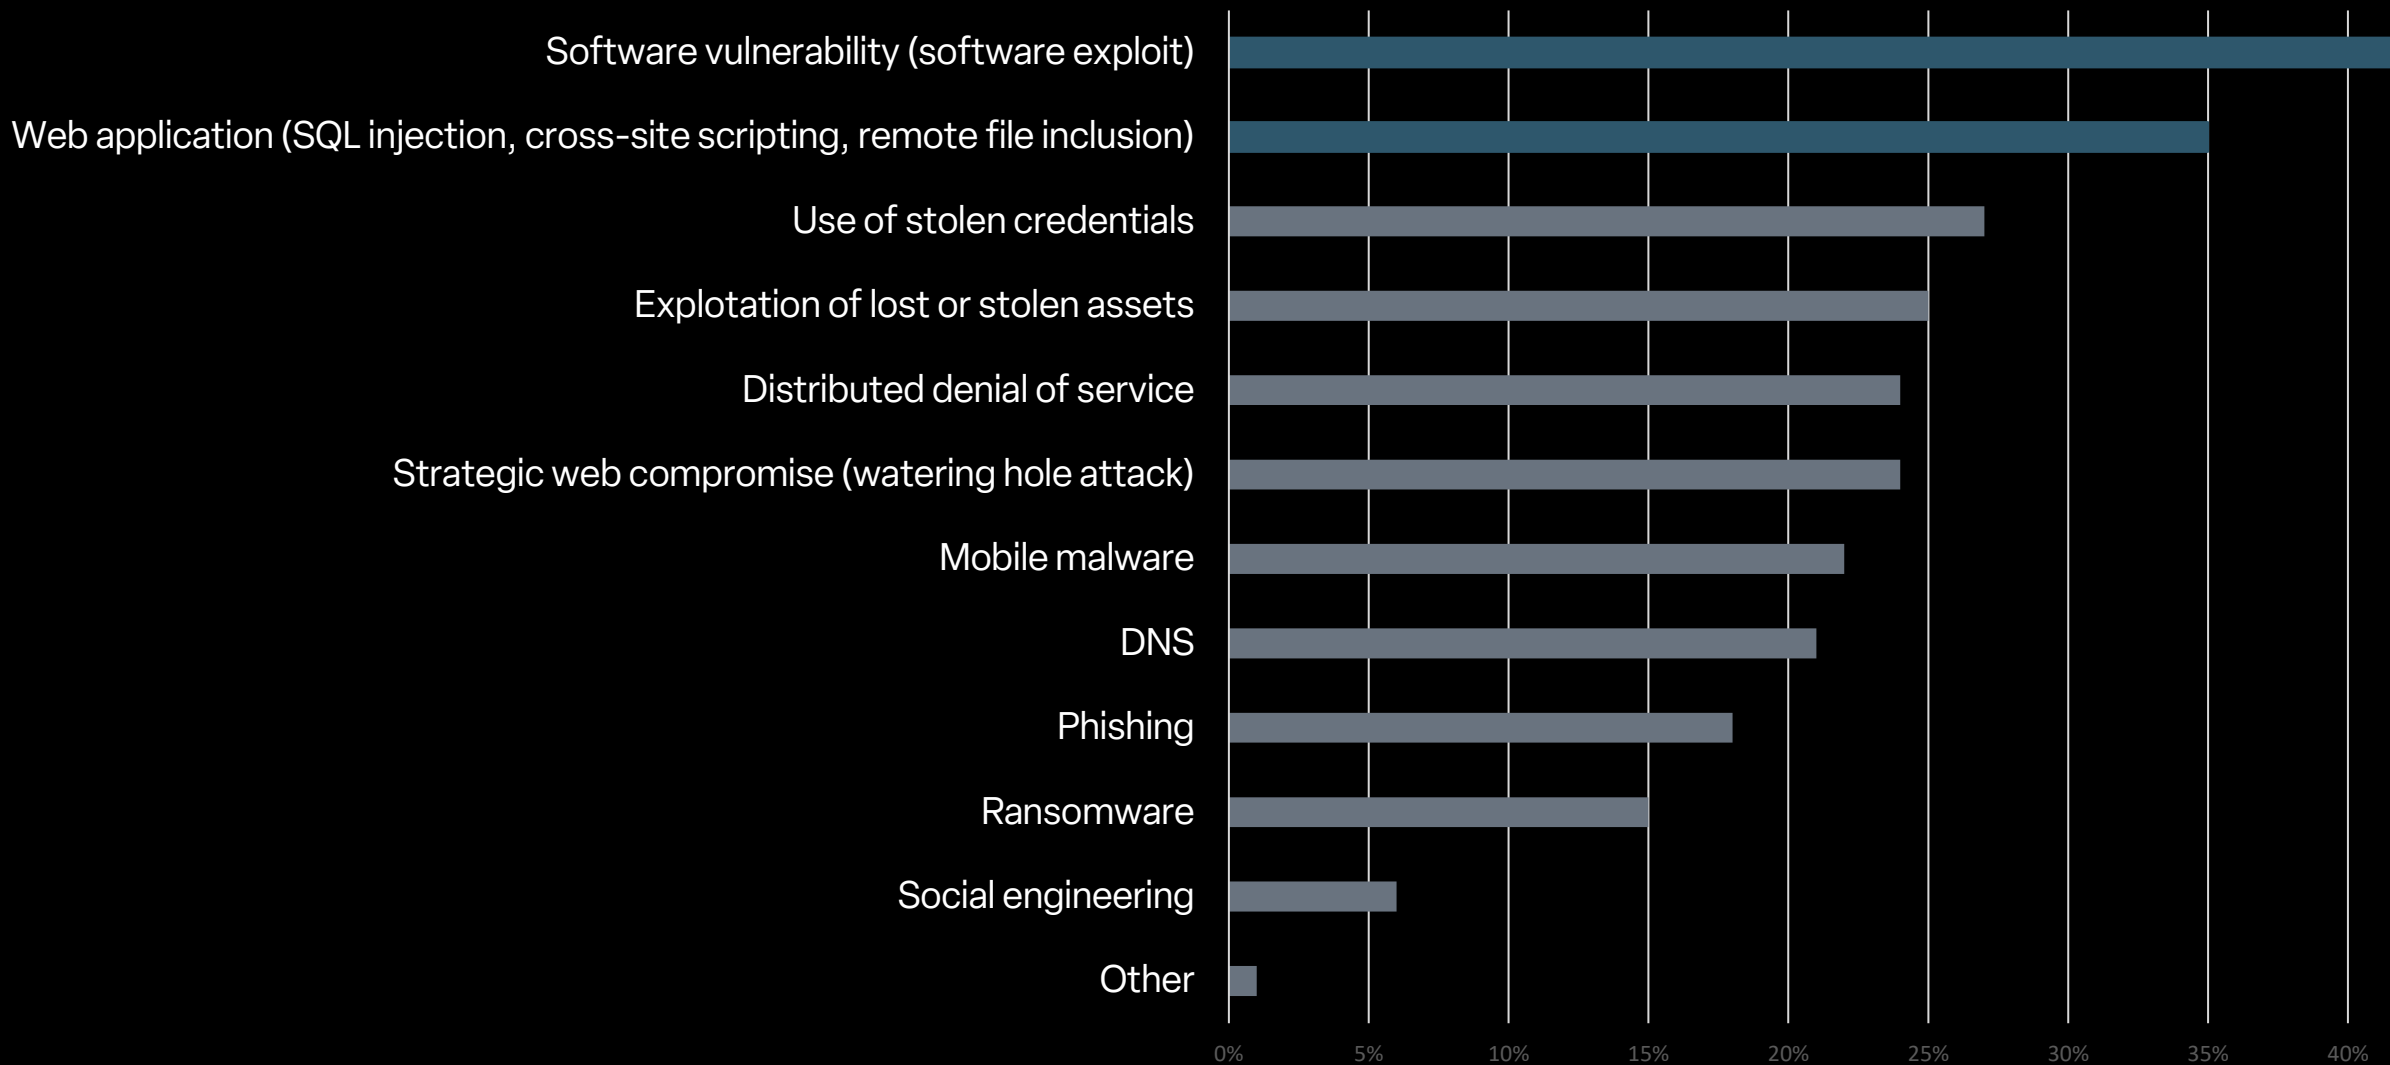

Viktor Laszlo - ConSecurity

Jobbat med utveckling i 25+
år. Fokus på QA och
Säkerhet.

Hur genomfördes det externa hacket?

Vilken åtgärd ger störst effekt?

Säkerhetsutbildning

Säkerhetsutbildning

- Alla i organisationen deltar
- Olika typer av hot och attacker
- Regler och policies
- Säker utveckling
- Informationssäkerhet och informationsklassificering
- Ökat medvetande och säkerhetsfokus
- Förnyas årligen

Hotmodelling

Hotmodellering

Systematiskt lista alla möjliga sätt hur en applikation kan attackeras.

Hotmodelling

Spoofing

Tampering

Repudiation

Information
Disclosure

Denial of
Service

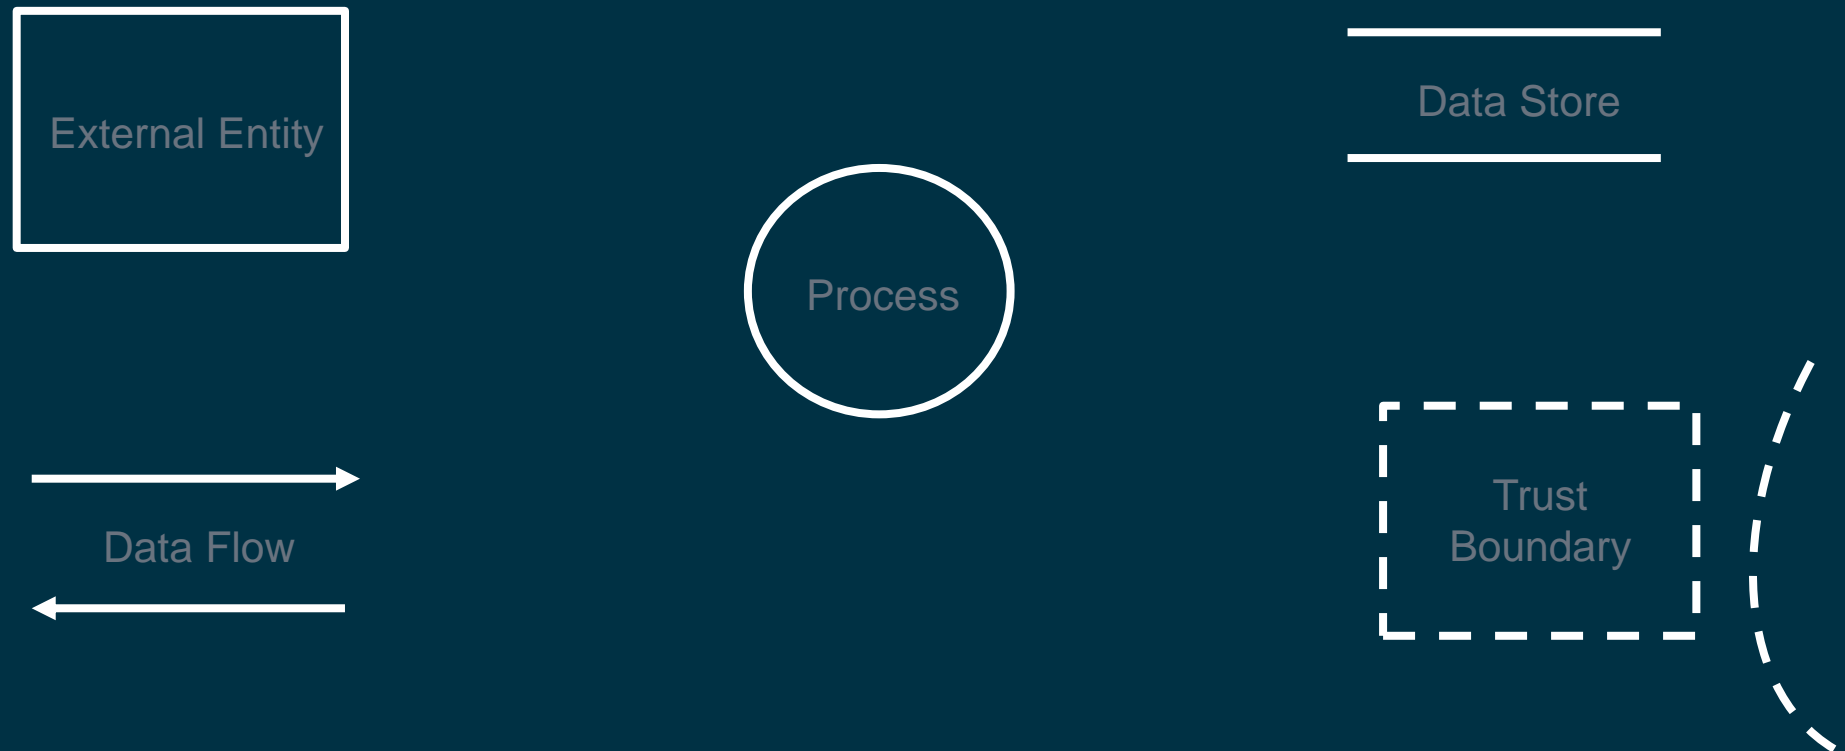

Elevation of
Privilege

Hotmodellinging - STRIDE

| Property | Threat | Definition | Example |
|-----------------|------------------------|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Authentication | Spoofing | Impersonating something or someone else. | Pretending to be any of billg, microsoft.com or ntdll.dll |
| Integrity | Tampering | Modifying data or code | Modifying a DLL on disk or DVD, or a packet as it traverses the LAN. |
| Non-repudiation | Repudiation | Claiming to have not performed an action. | "I didn't send that email," "I didn't modify that file," "I certainly didn't visit that web site, dear!" |
| Confidentiality | Information Disclosure | Exposing information to someone not authorized to see it | Allowing someone to read the Windows source code; publishing a list of customers to a web site. |
| Availability | Denial of Service | Deny or degrade service to users | Crashing Windows or a web site, sending a packet and absorbing seconds of CPU time, or routing packets into a black hole. |
| Authorization | Elevation of Privilege | Gain capabilities without proper authorization | Allowing a remote internet user to run commands is the classic example, but going from a limited user to admin is also EoP. |

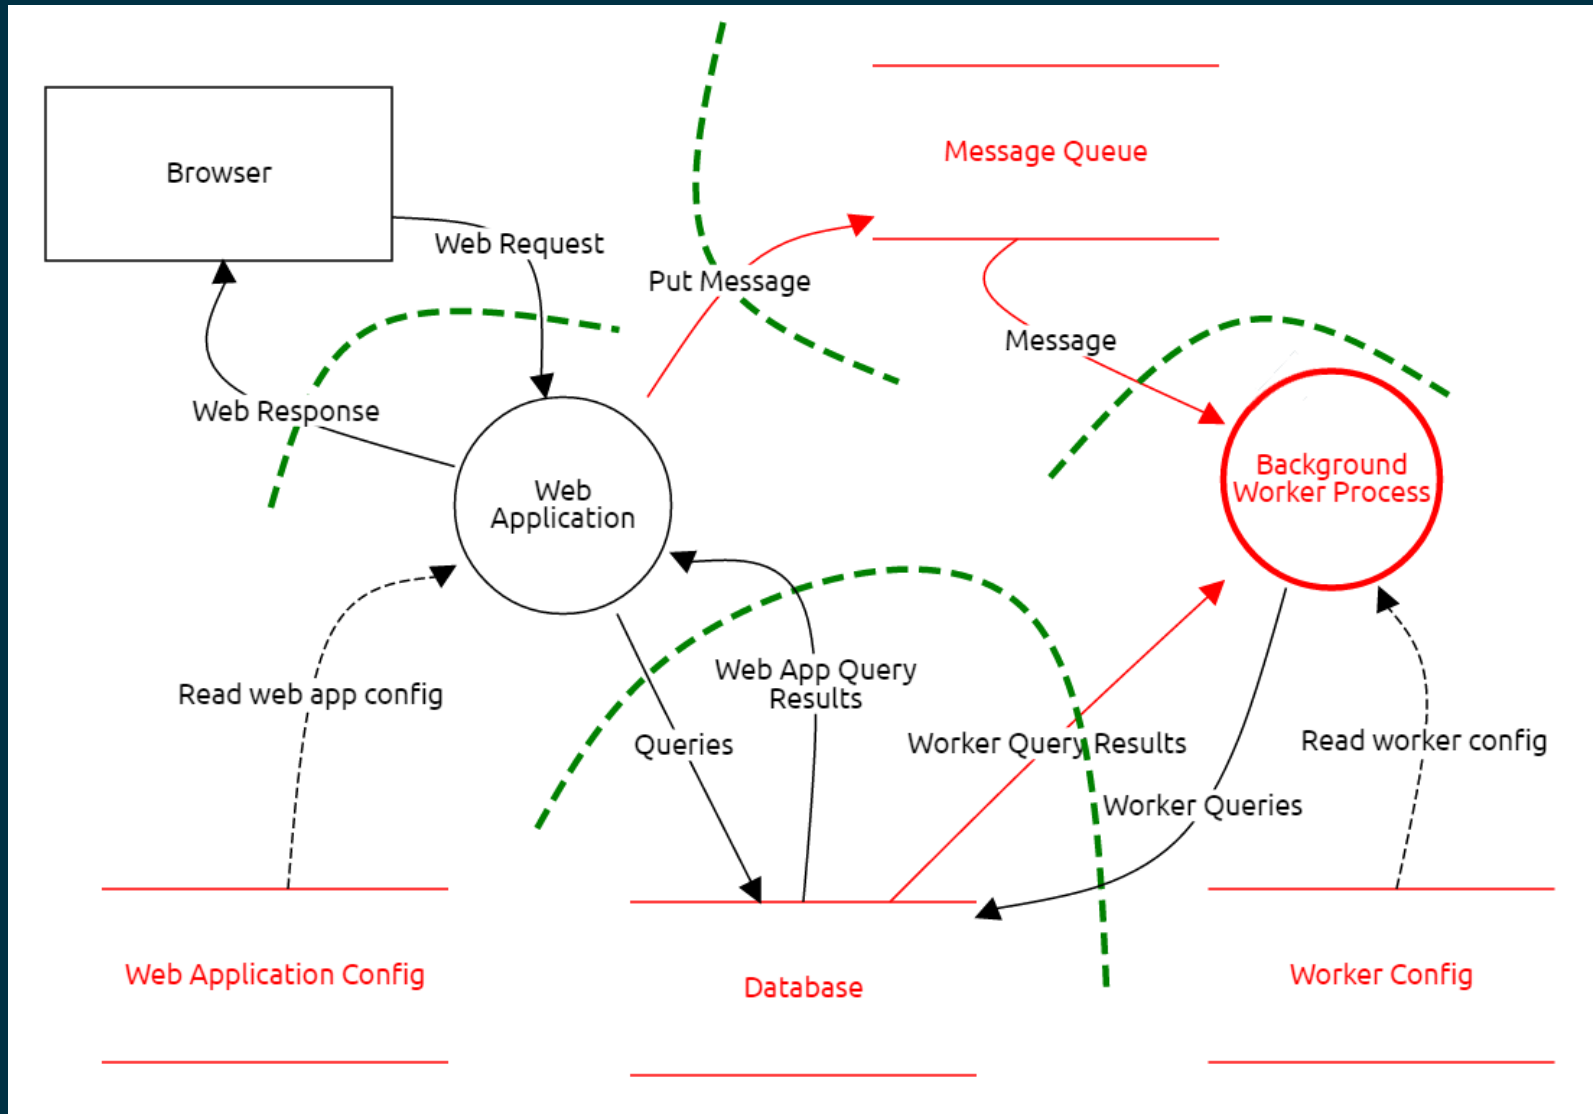

Hotmodelling - Element

STRIDE per Element

| Element | Spoofing | Tampering | Repudiation | Information Disclosure | Denial of Service | Elevation of Privilege |

Säkerhetstester

OWASP Application Security Verification Standard

- Första applikationssäkerhetsstandarden av utvecklare, för utvecklare.
- Varje objekt är ett enda koncept.
- Helt öppen källkod och delningsbar.

Level 1 - Bara grunderna

- 136 Kontroller (Krav)
- Lätt automatiserad.
- Lägsta godtagbar säkerhet.
- Otillräckligt för att bygga en säker applikation.
- Lätt att automatisera med hjälp av verktyg.

Level 2 – Rekommenderad nivå

- 267 Kontroller (Krav)
- Vissa kontroller är engångsaktiviteter.
 - Ha en SDL (säker SDLC)
 - Använd versionshanteringssystem (scv)
 - Använd en defekt tracker.
 - Använd repeterbar, säker deployment
- De flesta kan enhets- och/eller integrationstestas.

Level 3 - För appar som kan döda dig eller förstöra ekonomin

- 286 Kontroller (Krav)
- Lämplig för:
 - Medicinska applikationer och apparater.
 - OT – kraft, vatten, avlopp, kemiska anläggningar, kärnkraftverk m.m.
 - Finansiella applikationer som kan förstöra ekonomin.
- Säkerhetsnivån är maximal.
- Nivån av paranoia är hög.

Application Security Verification Standard 4.0.3

October 2021

1. Architecture, Design and Threat Modeling
2. Authentication
3. Session Management
4. Security Verification Requirements
5. Validation, Sanitization and Encoding
6. Stored Cryptography
7. Error Handling and Logging
8. Data Protection
9. Communication
10. Malicious Code
11. Business Logic
12. Files and Resources
13. API and Web Service
14. Configuration

2. Authentication

- V2.1 Password Security
- V2.2 General Authenticator Security
- V2.3 Authenticator Lifecycle
- V2.4 Credential Storage
- V2.5 Credential Recovery
- V2.6 Look-up Secret Verifier
- V2.7 Out of Band Verifier
- V2.8 One Time Verifier
- V2.9 Cryptographic Verifier
- V2.10 Service Authentication

V2.1 Password Security

Passwords, called "Memorized Secrets", include passwords, PINs, unlock patterns, pick the correct kitten or another image element, and passphrases.

They are generally considered "something you know", and often used as single-factor authenticators.

Applications should strongly encourage users to enroll in multi-factor authentication, or link to a credential service provider that provides multi-factor authentication.

V2.1 Password Security

| # | Description | L1 | L2 | L3 | CWE |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|----|----|-----|
| 2.1.1 | Verify that user set passwords are at least 12 characters in length (after multiple spaces are combined). (C6) | ✓ | ✓ | ✓ | 521 |
| 2.1.2 | Verify that passwords of at least 64 characters are permitted, and that passwords of more than 128 characters are denied. (C6) | ✓ | ✓ | ✓ | 521 |
| 2.1.3 | Verify that password truncation is not performed. However, consecutive multiple spaces may be replaced by a single space. (C6) | ✓ | ✓ | ✓ | 521 |
| 2.1.4 | Verify that any printable Unicode character, including language neutral characters such as spaces and Emojis are permitted in passwords. | ✓ | ✓ | ✓ | 521 |
| 2.1.5 | Verify users can change their password. | ✓ | ✓ | ✓ | 620 |
| 2.1.6 | Verify that password change functionality requires the user's current and new password. | ✓ | ✓ | ✓ | 620 |
| 2.1.7 | Verify that passwords submitted during account registration, login, and password change are checked against a set of breached passwords either locally (such as the top 1,000 or 10,000 most common passwords which match the system's password policy) or using an external API. If using an API a zero knowledge proof or other mechanism should be used to ensure that the plain text password is not sent or used in verifying the breach status of the password. If the password is breached, the application must require the user to set a new non-breached password. (C6) | ✓ | ✓ | ✓ | 521 |
| 2.1.8 | Verify that a password strength meter is provided to help users set a stronger password. | ✓ | ✓ | ✓ | 521 |
| 2.1.9 | Verify that there are no password composition rules limiting the type of characters permitted. There should be no requirement for upper or lower case or numbers or special characters. (C6) | ✓ | ✓ | ✓ | 521 |
| 2.1.10 | Verify that there are no periodic credential rotation or password history requirements. | ✓ | ✓ | ✓ | 263 |
| 2.1.11 | Verify that "paste" functionality, browser password helpers, and external password managers are permitted. | ✓ | ✓ | ✓ | 521 |
| 2.1.12 | Verify that the user can choose to either temporarily view the entire masked password, or temporarily view the last typed character of the password on platforms that do not have this as built-in functionality. | ✓ | ✓ | ✓ | 521 |

CWE-521: Weak Password Requirements

Description:

The product does not require that users should have strong passwords, which makes it easier for attackers to compromise user accounts.

Related Attack Patterns:

| | |
|-----------|-----------------------------------------------|
| CAPEC-112 | Brute Force |
| CAPEC-16 | Dictionary-based Password Attack |

| CAPEC-565 | Password Spraying |
| CAPEC-70 | Try Common or Default Usernames and Passwords |

CAPEC-112: Brute Force

Description

In this attack, some asset (information, functionality, identity, etc.) is protected by a finite secret value. The attacker attempts to gain access to this asset by using trial-and-error to exhaustively explore all the possible secret values in the hope of finding the secret (or a value that is functionally equivalent) that will unlock the asset.

Typical Severity

High

Prerequisites

The attacker must be able to determine when they have successfully guessed the secret. As such, one-time pads are immune to this type of attack since there is no way to determine when a guess is correct.

Skills Required

[Level: Low]

The attack simply requires basic scripting ability to automate the exploration of the search space. More sophisticated attackers may be able to use more advanced methods to reduce the search space and increase the speed with which the secret is located.
